- ► DDSS

# R/RStudio/RMarkdown and Why?

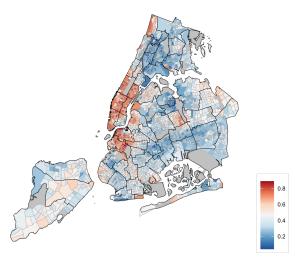

- ▶ R is a statistical programming language great for data analysis and data science applications
- RStudio is an Integrated Development Environment (IDE)-basically just a nice interface for using R, writing/running code, and interacting with data and files
- RMarkdown is a file format that lets you combine R code, data, and text that outputs a document, report, slideshow, etc.

## Cool things you can do with R

- Easy and intuitive management of code and data
- Excellent visualization capabilities, including charts, maps, interactive dashboards etc.
- Easily output analysis into a digestible format
- can handle a wide arrange of statistical analysis, data analysis, and data science applications

Share of Creative Class Workers in NYC Census Tracts (by PUMA/Community District)

#### A Pandoc Markdown Article Starter and Template \*

Steven V. Miller Clemson University

This document provides an introduction to R Markdown, argues for its benefits, and presents a sample manuscript template intended for an academic audience. I include basic syntax to R Markdown and a minimal working example of how the analysis itself can be conducted within R with the knitr package.

Keywords: pandoc, r markdown, knitr

#### Introduction

Academic workflow, certainly in political science, is at a crossroads. The American Journal of Prelitial Science (Alga) announced a (pw woods) "show your work" initiative in which authors who wish cathors who which authors who wish cathoring produced the results shown in the manuscript. The editorial team at AJPS hen reproduces the code from the manuscript. Prending successful replication, the manuscript howes toward publication. The AJPS might be at the ore of this movement, and it could be the most aggressive anomaly and among political science journals, but other journals in our field have signed the joint Data Access so the Company of th

There are workflow implications to the Lacour controversy as well. Political science, for the foreseeable future, will struggle with the extent of the data fraud prepertated by Michael Lacour in an article co-authored with Donald P. Green in Science, the general scientific journal of record in the United States. A failure to reproduce LaCour's Faults with different samples uncovered a comprehensive effort by LaCour to "faile" data that provided results to what we felt or believed to be true (i.e. "truthines"). However, fails ded atta on have real consequences for both the researcher and those who want to learn from it and use if for various purposes. Even research done honestly may suffer the same fails of researchers are not dilizent in their workflow.

These recent events underscore the DART push and cost a shadow over our workflow. However, good workflow has always been an issue in our discipline. Cloud storage services like Dropbox are still relatively new among political scientists. Without cloud storage, previous workflow led ropen the possibility that work between a home computer and an office computer was lost as a function of a corrupted thumb drive, an overheated power supply, or, among other things, the wave of viruses that would particularly affect Microsoft unes every summer. Scalal sciences, uriliate engineering, have traditionally relied on software like Microsoft Word for manuscrip repearation through any word processor reduces workflow to a serie of citicks and strokes on a keytance of the computer of the stroke of the control of the stroke of the control of the control of the stroke of the control of th

I think there is reason for optimism. We only struggle with it now because we have tools like R Markdown and Pandoc, more generally, that make significant strides in workflow. LaTeX resolved earlier issues of corrupted binary files by reducing documents to raw markup that was little more

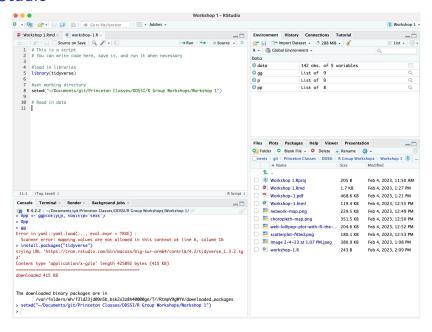

<sup>\*</sup>Replication files are available on the author's Github account (http://github.com/svmiller). Current version: July 26, 2019; Corresponding author: svmille@clemson.edu.

Goals

## Today's workshop

- Learn the basics and fundamentals of working in RStudio and RMarkdown
- ► Learn a framework for reproducible analysis that can be applied to homework, work assignments, etc.
- Go through an analysis together to combine these
- Leave with a file that can serve as a template for future work

#### **RStudio**

### R Scripts and R Markdown

- ► R Script (workshop-1.R)
  - ► A file that only runs normal R code
- ► RMarkdown Script (workshop-1.Rmd)
  - A different file type that combines code and text to produce a document that includes both
- Both a .R and .Rmd file are provided

# Reproducible Analysis

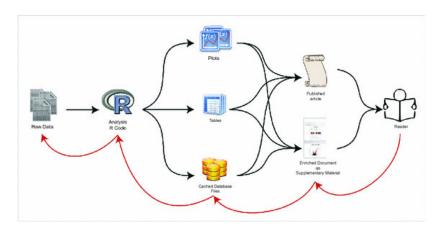

Figure 6: Source: Russo, Righeli, Angelini

# Why you should care

- It will save you time and make analyses easy to update/run again
- Eliminates room for mistakes
- Easily shared and validated by others—especially crucial for analysis informing public policy

# What to keep in mind for our purposes

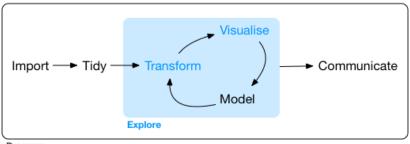

- ► The ideal: someone else (including and especially you, at a later date) should be able to
  - (1) Read your code file and understand what you did and why (code comments are everyone's friend)
  - (2) Re-run your code without making any edits and produce the same results
- In practice:
  - Any data cleaning, transformations to the data, edits, analyses, etc. should be documented in an R script
  - No edits should be made manually!!! (don't edit your data in excel, don't manually enter or copy/paste output, etc.)

#### **Tidyverse**

- ➤ A collection of R packages made for data/statistical analysis with the same underlying structure, intuitive syntax and philosophy
- Great for working with and manipulating a wide variety of datasets
- We will use tidyverse today

# Tidyverse

Program

# Learn!

# What we will do today

- ► Go through and reproduce a shortened version of Project 2 from last semester's 507c class
- use tidyverse to:
  - read in data
  - clean/transform data
  - generate summary statistics
  - run a regression model
  - output results in a summary memo document

#### **Files**

- workshop-1.R
  - this is just an R script with all the code for your reference later
- workshop-1-skeleton.Rmd
  - an RMarkdown code skeleton for you to fill out as we go
- workshop-1-solutions.Rmd
  - the same RMarkdown code file as above, but with all the code and solutions

# Rmarkdown: Output

### Project 2

Your Name 2023-02-05

#### Overview

This document provides high-level information on whether the minimum legal drinking age (MLDA) makes any difference in the likelihood of consuming alcohol. It includes:

- . Code to read in and clean data
- · Summary Statistics
- Regression output

## R Programming Basics

```
# object assignment
# (strings, numbers, dataframes, lists, etc.)
this_is_an_object <- "object"

```
mean(mlda$student)

## [1] 0.1004848

mean(mlda$drinks_alcohol)
```

### Transform, explore, and visualize

#### Dplyr

The most useful tool in the tidyverse is dplyr. It's a swiss-army knife for data wrangling. dplyr has many handy functions that we recommend incorporating into your analysis:

- select() extracts columns and returns a tibble.
- arrange() changes the ordering of the rows.
- filter() picks cases based on their values.
- mutate() adds new variables that are functions of existing variables.
- rename() easily changes the name of a column(s)
- summarise() reduces multiple values down to a single summary.
- pull() extracts a single column as a vector.
- \_join() group of functions that merge two data frames together, includes (inner\_join(), left\_join(), right\_join(), and full\_join()).

Figure 7: "Source: https://hbctraining.github.io/Intro-to-R/lessons/tidyverse\_data\_wrangling.html"

# Tidyverse Function Syntax

Table 1: Useful dplyr functions and syntax

Function	Syntax
select()	select(df, var1, var2,)
mutate()	$mutate(df, new\_var = old\_var + 5)$
filter()	filter(df, var1 == value)
rename()	$rename(df, new\_name = old\_name)$
summarise()	$summarise(df,mean\_var1 = mean(var1))$
if_else()	<pre>if_else(condition, true, false)</pre>

#### Transform and explore

```
## # A tibble: 1 x 5

## min_age mean_age median_age mean_perc_days_drink median_perc_days_drink

## <dbl> <dbl> <dbl> <dbl> <dbl> + dbl> = 17.7 19.8 13.3 6.58
```

# The Pipe

► The pipe operate %>% takes output from on function and 'pipes' it into another function

```
x <- paste("A", "String")
print(x)

print(paste("A", "String"))

paste("A", "String") %>%
    print(.)
```

# Use the pipe operator to combine all of these into one 'dplyr chain'

► The period denotes where the previous output should be the argument in the new function

```
## # A tibble: 1 x 5

## min_age mean_age median_age mean_perc_days_drink median_perc_days_drink

## <dbl> <dbl> <dbl> <dbl> <dbl> 17.7 19.8 13.3 6.58
```

# More Summary Statistics

```
# now let's look at summary stats of heavy drinkers vs non-heavy drinkers:

# demographic characteristics of heavy drinkers vs non-heavy drinkers
summ_stats_heavy <- mlda %>%
filter(drinks_alcohol ==1) %>%
group_by(., heavy_drinker) %>%
summarise(., min_age = min(age_years),
mean_age = mean(age_years),
mean_age = mean(age_years),
mean_student = mean(student),
n = n()
summ_stats_heavy
```

```
## # A tibble: 2 x 6
    heavy_drinker min_age mean_age median_age mean_student
##
           <dbl>
                  <db1>
                                    <db1>
                                               <dbl> <int>
                        <dbl>
                               24.9
## 1
                   17.8
                           24.7
                                              0.0874 37322
## 2
                   17.7
                           25.3
                                    25.7
                                              0.0425
                                                      964
```

# Try yourself

- Create a variable that denotes someone as an underage drinker (they are less than 21 years old and drink alcohol)
- Use the skeleton code below to calculate the share of underage drinkers that are a student, married, male, Hispanic, Black, or white

```
summ_stats2 <- mutate(mlda, underage_drinker = if_else()) %>%
filter() %>%
summarise()
```

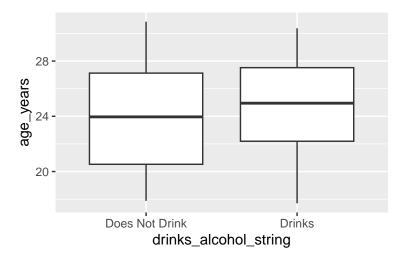

# Export as a table

Table 2: Drinking Patterns among Underage Drinkers

Minimum Age	Mean Age	Median Age	Avg Percent Days Drank	Median Percent Days Drank
17.7	19.7	19.8	13.3	6.6

## Visual: age distribution of drinkers vs non-drinkers?

```
viz <- mlda %>%
mutate(drinks_alcohol_string = if_else(drinks_alcohol == 1, "Drinks", "Does Not Drink")) %>%
ggplot(aes(x=drinks_alcohol_string, y=age_years)) +
geom_boxplot()
viz
```

#### Run a Model

- ► Use a linear probability model to predict the effect of age in years on the likelihood of drinking alcohol
- we can use lm()

```
# general form

lpm1 <- lm(formula = y ~ x_1 + x_2 + ... x_n, data = df)
```

y is the dependent variable and the x variables are the dependent variables

#### Model our data

```
# lpm of years in age on likelihood of drinking alcohol
lpm1 <- lm(formula = drinks_alcohol ~ age_years, data = mlda )</pre>
summary(lpm1)
##
## Call:
## lm(formula = drinks alcohol ~ age years, data = mlda)
##
## Residuals:
##
      Min
              10 Median
                                      Max
## -0.7365 -0.5766 0.3128 0.3852 0.4922
##
## Coefficients:
               Estimate Std. Error t value Pr(>|t|)
##
## (Intercept) 0.1999271 0.0140917 14.19 <2e-16 ***
## age years 0.0173927 0.0005712 30.45 <2e-16 ***
## ---
## Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.4805 on 61261 degrees of freedom
## Multiple R-squared: 0.01491, Adjusted R-squared: 0.01489
## F-statistic: 927.3 on 1 and 61261 DF, p-value: < 2.2e-16
```

#### Exercise

Now, add an age squared and age cubed variable to your dataset and rerun the model

```
mlda <- mlda %>%
mutate()

1pm2 <- lm(formula = , data = )
```

Then add additional demographic controls to your model and rerun the model

```
lpm3 <- lm(formula = drinks_alcohol ~ , data =)</pre>
```

inspect your results

```
summary(1pm2)
summary(1pm3)
```

## Use Stargazer to output your results

Note:

Stargazer is an R package that creates LATEX code, HTML code and ASCII text for well-formatted regression tables, with multiple models side-by-side, and summary stats, etc.

Table 3:

	Dependent variable:				
	Probabilty of Drinking				
	(1)	(2)			
age_years	0.017***	1.697***			
	(0.001)	(0.104)			
age_sq		-0.065***			
		(0.004)			
age_cu		0.001***			
		(0.0001)			
Constant	0.200***	-13.996***			
	(0.014)	(0.817)			
Observations	61,263	61,263			
$R^2$	0.015	0.031			
Adjusted R <sup>2</sup>	0.015	0.031			
Residual Std. Error	0.481 (df = 61261)	0.476 (df = 61259)			
F Statistic	927.281*** (df = 1; 61261)	661.294*** (df = 3; 61259)			

\*p<0.1: \*\*p<0.05: \*\*\*p<0.01

# Output model results

Table 4:

	Dependent variable: Probabilty of Drinking with Controls				
	(1)	(2)	(3)		
age_years	0.017***	1.697***	1.710***		
-	(0.001)	(0.104)	(0.102)		
age_sq		-0.065***	-0.066***		
· -		(0.004)	(0.004)		
age_cu		0.001***	0.001***		
		(0.0001)	(0.0001)		
student			-0.025***		
			(0.007)		
male			0.179***		
			(0.004)		
Constant	0.200***	-13.996***	-14.167***		
	(0.014)	(0.817)	(0.803)		
Observations	61,263	61,263	61,263		
$R^2$	0.015	0.031	0.065		
Adjusted R <sup>2</sup>	0.015	0.031	0.065		
Residual Std. Error	0.481 (df = 61261)	0.476 (df = 61259)	0.468 (df = 61257)		
F Statistic	927.281*** (df = 1; 61261)	661.294*** (df = 3; 61259)	855.417*** (df = 5; 61257)		

*Note:* \*p<0.1; \*\*p<0.05; \*\*\*p<0.01

# Visualize the discontinuity

```
library(rdrobust)
rdplot(mlda$drinks_alcohol,mlda$age_years,c=21)
```
